

Chapter 12 - Templates

Outline

- 12.1 Introduction**
- 12.2 Function Templates**
- 12.3 Overloading Template Functions**
- 12.4 Class Templates**
- 12.5 Class Templates and Non-type Parameters**
- 12.6 Templates and Inheritance**
- 12.7 Templates and friends**
- 12.8 Templates and static Members**

12.1 Introduction

- Templates - easily create a large range of related functions or classes
 - function template - the blueprint of the related functions
 - template function - a specific function *made* from a function template

12.2 Function Templates

- overloaded functions
 - perform similar operations on different data types
- function templates
 - perform identical operations on different data types
 - provide type checking

- Format:

```
template<class type, class type...>
```

- can use **class** or **typename** - specifies type parameters

```
template< class T >
```

```
template< typename ElementType >
```

```
template< class BorderType, class FillType >
```

- Function definition follows **template** statement

12.2 Function Templates (II)

```
1  template< class T >
2  void printArray( const T *array, const int
count )
3  {
4      for ( int i = 0; i < count; i++ )
5          cout << array[ i ] << " ";
6
7      cout << endl;
8  }
```

T is the type parameter. **T**'s type is detected and substituted inside the function.

The newly created function is compiled.

The **int** version of **printArray** is

```
void printArray( const int *array, const int count )
{
    for ( int i = 0; i < count; i++ )
        cout << array[ i ] << " ";

    cout << endl;
}
```

1. Function template definition

1.1 Initialize variables

2. Call template functions

3. Output

```
1 // Fig 12.2: fig12_02.cpp
2 // Using template functions
3 #include <iostream>
4
5 using std::cout;
6 using std::endl;
7
8 template< class T >
9 void printArray( const T *array, const int count )
10 {
11     for ( int i = 0; i < count; i++ )
12         cout << array[ i ] << " ";
13
14     cout << endl;
15 }
16
17 int main()
18 {
19     const int aCount = 5, bCount = 7, cCount = 6;
20     int a[ aCount ] = { 1, 2, 3, 4, 5 };
21     double b[ bCount ] = { 1.1, 2.2, 3.3, 4.4, 5.5, 6.6, 7.7 };
22     char c[ cCount ] = "HELLO"; // 6th position for null
23
24     cout << "Array a contains:" << endl;
25     printArray( a, aCount ); // integer template function
26
27     cout << "Array b contains:" << endl;
28     printArray( b, bCount ); // double template function
29
30     cout << "Array c contains:" << endl;
31     printArray( c, cCount ); // character template function
32
33     return 0;
34 }
```

Notice how type parameter T is used in place of **int**, **float**, etc. .

Each type array gets operated on by a different template function.

Outline

Program Output

Array a contains:

1 2 3 4 5

Array b contains:

1.1 2.2 3.3 4.4 5.5 6.6 7.7

Array c contains:

H E L L O

12.3 Overloading Template Functions

- related template functions have same name
 - compiler uses overloading resolution to call the right one
- function template can be overloaded
 - other function templates can have same name but different number of parameters
 - non-template function can have same name but different arguments
- compiler tries to match function call with function name and arguments
 - if no precise match, looks for function templates
 - if found, compiler generates and uses template function
 - if no matches or multiple matches are found, compiler gives error

12.4 Class Templates

- class templates
 - allow type-specific versions of generic classes
- Format:

```
template <class T>
class ClassName{
    definition
}
```

- Need not use "**T**", any identifier will work
- To create an object of the class, type

```
ClassName< type > myObject;
```

Example: **Stack< double > doubleStack;**

12.4 Class Templates (II)

- Template class functions
 - declared normally, but preceded by **template<class T>**
 - generic data in class listed as type **T**
 - binary scope resolution operator used
 - Template class function definition:

```
template<class T>
MyClass< T >::MyClass(int size)
{
    myArray = new T[size];
}
```

 - constructor definition - creates an array of type **T**

1. Class template definition

1.1 Function definitions

1.2 Stack constructor

```
1 // Fig. 12.3: tstack1.h
2 // Class template Stack
3 #ifndef TSTACK1_H
4 #define TSTACK1_H
5
6 template< class T >
7 class Stack {
8 public:
9     Stack( int = 10 );    // default constructor (stack size 10)
10    ~Stack() { delete [] stackPtr; } // destructor
11    bool push( const T& ); // push an element onto the stack
12    bool pop( T& );        // pop an element off the stack
13 private:
14    int size;              // # of elements in the stack
15    int top;               // location of the top element
16    T *stackPtr;           // pointer to the stack
17
18    bool isEmpty() const { return top == -1; } // utility
19    bool isFull() const { return top == size - 1; } // functions
20 };
21
22 // Constructor with default size 10
23 template< class T > ←
24 Stack< T >::Stack( int s )
25 {
26     size = s > 0 ? s : 10;
27     top = -1;                // Stack is initially empty
28     stackPtr = new T[ size ]; // allocate space for elements
29 }
```

Notice how a member function of the class template is defined

1.3 push

1.4 pop

```
30
31 // Push an element onto the stack
32 // return 1 if successful, 0 otherwise
33 template< class T >
34 bool Stack< T >::push( const T &pushValue )
35 {
36     if ( !isFull() ) {
37         stackPtr[ ++top ] = pushValue; // place item in Stack
38         return true; // push successful
39     }
40     return false; // push unsuccessful
41 }
42
43 // Pop an element off the stack
44 template< class T >
45 bool Stack< T >::pop( T &popValue )
46 {
47     if ( !isEmpty() ) {
48         popValue = stackPtr[ top-- ]; // remove item from Stack
49         return true; // pop successful
50     }
51     return false; // pop unsuccessful
52 }
53
54 #endif
```

Test if the stack is full. If not, push element.

Test if the stack is empty. If not, pop an element.

Outline

1. Load header

1.1 Initialize doubleStack

1.2 Initialize variables

2. Function calls

```
55 // Fig. 12.3: fig12_03.cpp
56 // Test driver for Stack template
57 #include <iostream>
58
59 using std::cout;
60 using std::cin;
61 using std::endl;
62
63 #include "tstack1.h"
64
65 int main()
66 {
67     Stack< double > doubleStack( 5 );
68     double f = 1.1;
69     cout << "Pushing elements onto doubleStack\n";
70
71     while ( doubleStack.push( f ) ) { // success true returned
72         cout << f << ' ';
73         f += 1.1;
74     }
75
76     cout << "\nStack is full. Cannot push " << f
77         << "\n\nPopping elements from doubleStack\n";
78
79     while ( doubleStack.pop( f ) ) // success true returned
```

Pushing elements onto doubleStack

1.1 2.2 3.3 4.4 5.5

Stack is full. Cannot push 6.6

Popping elements from doubleStack

2. Function calls

3. Output

```
cout << f << ' ';
```

```
5.5 4.4 3.3 2.2 1.1
```

```
cout << "\nStack is empty. Cannot pop\n";
```

```
Stack is empty. Cannot pop
```

```
Stack< int > intStack;
```

```
int i = 1;
```

```
cout << "\nPushing elements onto intStack\n";
```

```
Pushing elements onto intStack
```

```
while ( intStack.push( i ) ) { // success true returned
```

```
    cout << i << ' ';
```

```
1 2 3 4 5 6 7 8 9 10
```

```
    ++i;
```

```
}
```

```
cout << "\nStack is full. Cannot push " << i
```

```
Stack is full. Cannot push 11
```

```
    << "\n\nPopping elements from intStack\n";
```

```
Popping elements from intStack
```

```
while ( intStack.pop( i ) ) // success true returned
```

```
    cout << i << ' ';
```

```
10 9 8 7 6 5 4 3 2 1
```

```
cout << "\nStack is empty. Cannot pop\n";
```

```
Stack is empty. Cannot pop
```

```
return 0;
```

```
101}
```

Outline

Program Output

Pushing elements onto doubleStack

1.1 2.2 3.3 4.4 5.5

Stack is full. Cannot push 6.6

Popping elements from doubleStack

5.5 4.4 3.3 2.2 1.1

Stack is empty. Cannot pop

Pushing elements onto intStack

1 2 3 4 5 6 7 8 9 10

Stack is full. Cannot push 11

Popping elements from intStack

10 9 8 7 6 5 4 3 2 1

Stack is empty. Cannot pop

12.5 Class Templates and Non-type Parameters

- can use non-type parameters in templates
 - default argument
 - treated as **const**

- Example:

```
template< class T, int elements >  
Stack< double, 100 > mostRecentSalesFigures;
```

- declares object of type `Stack< double, 100>`

- This may appear in the class definition:

```
T stackHolder[ elements ]; //array to hold stack
```

- creates array at compile time, rather than dynamic allocation at execution time

12.5 Class Templates and Non-type Parameters (II)

- Classes can be overridden
 - for template class **Array**, define a class named **Array<myCreatedType>**
 - This new class overrides then class template for **myCreatedType**
 - The template remains for unoverriden types

12.6 Templates and Inheritance

- A class template can be derived from a template class
- A class template can be derived from a non-template class
- A template class can be derived from a class template
- A non-template class can be derived from a class template

12.7 Templates and friends

- friendships allowed between a class template and
 - global function
 - member function of another class
 - entire class
- **friend** functions
 - inside definition of class template **X**:
 - **friend void f1();**
 - **f1()** a **friend** of all template classes
 - **friend void f2(X< T > &);**
 - **f2(X< int > &)** is a **friend** of **X< int >** only. The same applies for **float**, **double**, etc.
 - **friend void A::f3();**
 - member function **f3** of class **A** is a **friend** of all template classes

12.7 Templates and friends (II)

- `friend void C< T >::f4(X< T > &);`
 - `C<float>::f4(X< float> &)` is a friend of class `X<float>` only

- **friend classes**

- `friend class Y;`
 - every member function of `Y` a friend with every template class made from `X`
- `friend class Z<T>;`
 - class `Z<float>` a friend of class `X<float>`, etc.

12.8 Templates and static Members

- non-template class
 - **static** data members shared between all objects
- template classes
 - each class (**int**, **float**, etc.) has its own copy of **static** data members
 - **static** variables initialized at file scope
 - each template class gets its own copy of **static** member functions
